4.9 Percent of Children in Orange County Lack Health Insurance *Potential Federal Cuts Could Increase Uninsured in Orange*

ORANGE--Good health provides a strong foundation for children's success in all areas of life, and health insurance coverage is a critical resource that supports health and wellness. Ninety-five percent of children in Orange have health insurance thanks in large part to expansions in coverage created by the Affordable Care Act, Medicaid, and NC Health Choice. But new data released today by NC Child shows federal health care reform could significantly affect Orange children's access to health insurance, particularly for the 9,448 children covered by public health insurance programs.

"The gains we have made in children's health insurance coverage are largely a result of investing in and strengthening public health insurance programs, like Medicaid and CHIP," said Laila A. Bell, director of research and data at NC Child. "If we want to build on our past progress, the U.S. Senate must reject the cuts to Medicaid and consumer protections in the American Health Care Act."

The data cards present local snapshot of key data points regarding children's well-being. These data points, including the children's health insurance rate, have the potential to worsen if the Senate approves the American Health Care Act (AHCA) or similar legislation, or if Congress fails to fund the Children's Health Insurance Program (CHIP). The AHCA rolls back key provisions of the Affordable Care Act and caps the Medicaid program, which would have a profound impact on Orange children's coverage and the benefits that are available to them. CHIP provides health insurance to over 100,000 children in North Carolina-- 1,041 of whom live in Orange. It's unclear how these children would maintain insurance coverage with the loss of federal funding.

The county data cards also show that not every child in Orange enjoys the same opportunities for good health.

"Orange has reached an all-time high in its children's health insurance coverage, mirroring the state and national trend," said Bell. "While we should celebrate this achievement, we should also look closely at the data regarding other factors that shape child health."

Bell says social and economic circumstance play a big role in children's health. In Orange County:

- **The life expectancy for a newborn at birth is 82 years**, -0.6 years shorter than in Chatham County which has the highest life expectancy for babies in NC.
- **7.0 percent of babies are born at a low birthweight** placing them at greater risk for lifelong health challenges.
- **19.1 percent of children live in households that are food insecure** and struggle to provide consistent and adequate nutrition.
- **31.7 of children live in poor or low-income homes**, a significant risk factor for children's academic and health success.

If left unaddressed these preventable obstacles can turn into permanent roadblocks that result in dead ends for Orange children's education, development, social and emotional outcomes.

"These health challenges are avoidable," Bell said. "We know that smart public policy decisions can help enhance local efforts to ensure all children in Orange live in homes and communities that support their health and development."

The county data cards identify three investments leaders and policymakers in Orange and North Carolina can make to significantly improve the health of its children and families:

- Increase health insurance access for low-income adults of reproductive age.
- Ensure children's access to health insurance.
- Strengthen public policies to promote health equity.
